ABSTRACT. Type specimens housed in the National Museum of Natural History of Cuba are listed. The collections contain 187 holotypes. Scientific name, author and description date, reference, catalogue number, original number, type locality, collector, date of collecting and preservation method are given for each specimen.

Key words: Type specimens, museum, collection, Cuba.

As recommend the International Code of Zoological Nomenclature (ICZN, 1999 72F.4), each museum or institution housing type specimens has the responsibility to make available to the scientific community a published catalogue of the names in their custody. The following is an updated catalogue of type specimens deposited in the scientific collections of the National Museum of Natural History of Cuba (MNHNCu).

There are two lists in the catalogue: 1. neontological holotypes (166 types). 2. paleontological specimens (21 types). The following information is provided for all taxa in alphabetic order by family in each list: scientific name, author, description date, catalogue number, original number, type locality (quoted from the original publication in the original wording and language), collector and date of collecting.

The preservation method differs for each group. The types of plants are dried flowers, fruits and stalk. The classes Arachnida, Diplopoda, Amphibia and Reptilia are preserved in alcohol at 70%. The holotypes of Coleoptera, Hymenoptera and Phasmatodea are dry pinned specimens. In the case of Dictyoptera those are pinned specimens too, but with the genitals in glycerin. The molluscs are dry shells, except for of one type that was preserved in alcohol. The birds are study skins. Fossils are dry, in rocks or bones.

Tables 1 and I2 offer information about the hierarchy of holotypes housed in the MNHNCu. In the last neontological catalogue (Lomba and Tejuca, 2004), the Museum kept 116 types, since then, 49 species new to science were added. The last paleontological catalogue (Díaz-Franco, 2004) included 19 vertebrates. Here we add the invertebrates and update the vertebrates; thus, the list increased in two holotypes.
